Instructions for use

The following coverage policy applies to health benefit plans administered by Cigna. Coverage policies are intended to provide guidance in interpreting certain standard Cigna benefit plans and are used by medical directors and other health care professionals in making medical necessity and other coverage determinations. Please note the terms of a customer’s particular benefit plan document may differ significantly from the standard benefit plans upon which these coverage policies are based. For example, a customer’s benefit plan document may contain a specific exclusion related to a topic addressed in a coverage policy.

In the event of a conflict, a customer’s benefit plan document always supersedes the information in the coverage policy. In the absence of federal or state coverage mandates, benefits are ultimately determined by the terms of the applicable benefit plan document. Coverage determinations in each specific instance require consideration of:

1. The terms of the applicable benefit plan document in effect on the date of service
2. Any applicable laws and regulations
3. Any relevant collateral source materials including coverage policies
4. The specific facts of the particular situation

Coverage policies relate exclusively to the administration of health benefit plans. Coverage policies are not recommendations for treatment and should never be used as treatment guidelines.

This evidence-based medical coverage policy has been developed by eviCore, Inc. Some information in this coverage policy may not apply to all benefit plans administered by Cigna.

**CMM-313.1 Definitions**

**Hip arthroplasty** is an orthopaedic surgical procedure during which the articular surface of the hip joint is replaced, remodeled, or realigned.

**Hip replacement** is a form of arthroplasty which includes the surgical replacement of the hip joint with a prosthesis.

**Prosthesis** refers to an artificial device used to replace a structural element within a joint to improve and enhance function.

**Hip resurfacing arthroplasty (HRA)**, also called metal-on-metal (MOM) hip resurfacing and hemiresurfacing arthroplasty, is a surgical technique which involves the removal of diseased cartilage and bone from the head of the femur, and the replacement of the surface of the femoral head with a metal hemisphere that fits into a metal acetabular cup or into the acetabulum respectively. The technique conserves femoral bone and maintains normal femoral loading and stresses. Because of bone conservation, it may not compromise future total hip replacements. Hip resurfacing arthroplasty has been promoted as an alternative to total hip replacement for younger individuals. Hip resurfacing arthroplasty may be either a partial HRA (i.e., hemi-hip resurfacing, hemiresurfacing or femoral head resurfacing arthroplasty [FHRA]) or a total HRA.

**Partial hip replacement**, also called hip hemiarthroplasty, is a surgical technique where only the femoral head (the ball) of the damaged hip joint is replaced. The acetabulum (the socket) is not replaced.

**Total hip replacement** is a surgical technique which involves the removal of the damaged hip which is then replaced with an artificial prosthesis composed of two or three different components: 1) the head that replaces the original femoral head, 2) the femoral component (a metal stem placed into the femur), and 3) the acetabular component that is implanted into the acetabulum. The stem may be secured using bone cement or press-fit for the bone to grow into it.

**The Tönnis Classification System** is commonly used to describe the presence of osteoarthritis in the hips with grading as follows:

- Grade 0: No signs of osteoarthritis
- Grade 1: Sclerosis of the joint with slight joint space narrowing and osteophyte formation, and no or slight loss of femoral head sphericity
- Grade 2: Small cysts in the femoral head or acetabulum with moderate joint space narrowing and moderate loss of femoral head sphericity
- Grade 3: Large cysts in the femoral head or acetabulum, severe joint space narrowing or obliteration of the joint space, and severe deformity and loss of sphericity of the femoral head.
Total or partial hip revision involves surgical reconstruction or replacement due to failure or complications of previous hip replacement.

Non-surgical management, with regard to the treatment of hip osteoarthritis, is defined as any provider-directed non-surgical treatment, which has been demonstrated in the scientific literature as efficacious and/or is considered reasonable care in the treatment of hip pain from osteoarthritis. The types of treatment involved can include, but are not limited to: relative rest/activity modification, weight loss, supervised physiotherapy modalities and therapeutic exercises, oral prescription and non-prescription medications, assistive devices (e.g., cane, crutches, walker, wheelchair), and/or intra-articular injections (i.e., steroid).

CMM-313.2 General Guidelines

The determination of medical necessity for the performance of hip resurfacing, hip arthroplasty, and hip replacement (partial or total) is always made on a case-by-case basis.

Until the scientific literature is more definitive, the type of bearing surface, such as metal-on-metal, ceramic-on-ceramic, metal-on-polyethylene, should be determined by the treating surgeon and the patient following a frank discussion explaining the pros and cons of each bearing surface.

For individuals with significant medical conditions or co-morbidities, the risk/benefit of hip arthroplasty procedures should be clearly documented in the medical record.

CMM-313.3 Indications and Non-Indications

Partial Hip Resurfacing Arthroplasty

Partial hip resurfacing arthroplasty is considered medically necessary when ALL of the following criteria have been met:

- Function-limiting pain at short distances (e.g., walking less than ¼ mile, limiting activity to two city blocks, the equivalent to walking the length of a shopping mall) for at least three (3) months duration
- Loss of hip function which interferes with the ability to carry out age-appropriate activities of daily living and/or demands of employment
- Presence of EITHER of the following:
  - Degenerative arthritis primarily affecting the femoral head with joint space narrowing on weight-bearing radiographs
  - Osteonecrosis (avascular necrosis) of the femoral head when the disease is detected early and there is less than 50% involvement of the femoral head
- Individual is age 64 years or younger
Failure of at least three (3) months of provider-directed non-surgical management

Please note: Provider-directed non-surgical management may be inappropriate for joint destruction. The medical record must clearly document why provider-directed non-surgical management is not reasonable.

Partial hip resurfacing arthroplasty is considered not medically necessary when ANY of the following are present:

- Degenerative arthritis affecting both the femoral head and the acetabulum with joint space narrowing on weight-bearing radiographs
- Inflammatory arthropathy affecting both the femoral head and acetabulum
- Osteonecrosis (avascular necrosis) of the femoral head involving more than 50% of the femoral head
- Skeletal immaturity
- Active local or systemic infection
- One or more uncontrolled or unstable medical conditions that would significantly increase the risk of morbidity or mortality (e.g., cardiac, pulmonary, liver, genitourinary, or metabolic disease; hypertension; abnormal serum electrolyte levels)
- Vascular insufficiency, significant muscular atrophy of the hip or leg musculature, or neuromuscular disease severe enough to compromise implant stability or post-operative recovery
- Osseous abnormalities that cannot be optimally managed prior to surgery which would increase the likelihood of a poor surgical outcome (i.e., inadequate bone stock to support the implant)
- Severe immunocompromised state
- Charcot joint

Total Hip Resurfacing Arthroplasty

Total hip resurfacing arthroplasty is considered medically necessary when ALL of the following criteria have been met:

- Function-limiting pain at short distances (e.g., walking less than ¼ mile, limiting activity to two city blocks, the equivalent to walking the length of a shopping mall) for at least three (3) months duration
- Loss of hip function which interferes with the ability to carry out age-appropriate activities of daily living and/or demands of employment
- Presence of EITHER of the following:
- Degenerative arthritis primarily affecting the femoral head with joint space narrowing on weight-bearing radiographs
- Osteonecrosis (avascular necrosis) of the femoral head when the disease is detected early and there is less than 50% involvement of the femoral head

- Individual is age 64 years or younger
- Failure of at least three (3) months of provider-directed non-surgical management

**Please note:** Provider-directed non-surgical management may be inappropriate for joint destruction. The medical record must clearly document why provider-directed non-surgical management is not reasonable.

**Total hip resurfacing arthroplasty** is considered **not medically necessary** when ANY of the following are present:

- Osteonecrosis (avascular necrosis) of the femoral head involving more than 50% of the femoral head
- Skeletal immaturity
- Active local or systemic infection
- One or more uncontrolled or unstable medical conditions that would significantly increase the risk of morbidity or mortality (e.g., cardiac, pulmonary, liver, genitourinary, or metabolic disease; hypertension; abnormal serum electrolyte levels)
- Vascular insufficiency, significant muscular atrophy of the hip or leg musculature, or neuromuscular disease severe enough to compromise implant stability or post-operative recovery
- Osseous abnormalities that cannot be optimally managed prior to surgery which would increase the likelihood of a poor surgical outcome (i.e., inadequate bone stock to support the implant)
- Severe immunocompromised state
- Charcot joint

**Partial Hip Replacement**

**Partial hip replacement** is considered **medically necessary** when ANY of the following criteria have been met:

- A non-displaced intracapsular fracture is present and surgical fixation is not considered a reasonable option
An impacted fracture, partially displaced fracture, completely displaced or comminuted fracture of the femoral neck or femoral head is present and conservative management or surgical fixation is not considered a reasonable option.

Tönnis Grade 3 osteoarthritis or avascular necrosis with stage III collapse of the femoral head when ALL of the following criteria have been met:

- Function-limiting pain at short distances (e.g., walking less than ¼ mile, limiting activity to two city blocks, the equivalent to walking the length of a shopping mall) for at least three (3) months duration
- Loss of hip function secondary to osteoarthritis which interferes with the ability to carry out age-appropriate activities of daily living and/or their demands of employment
- Failure of at least three (3) months of provider-directed non-surgical management

Please note: Provider-directed non-surgical management may be inappropriate for joint destruction. The medical record must clearly document why provider-directed non-surgical management is not reasonable.

Partial hip replacement is considered not medically necessary when ANY of the following are present:

- Active local or systemic infection
- Osseous abnormalities that cannot be optimally managed prior to surgery which would increase the likelihood of a poor surgical outcome (i.e., inadequate bone stock to support the implant) unless the procedure is being performed for a fracture indication
- One or more uncontrolled or unstable medical conditions that would significantly increase the risk of morbidity (e.g., cardiac, pulmonary, liver, genitourinary, or metabolic disease; hypertension; abnormal serum electrolyte levels)
- Vascular insufficiency, significant muscular atrophy of the leg, or neuromuscular disease severe enough to compromise implant stability or post-operative recovery
- Severe immunocompromised state
- Charcot joint
- Inflammatory arthropathy affecting both the femoral head and acetabulum

Total Hip Replacement

Total hip replacement is considered medically necessary when ANY of the following criteria have been met:

- Active local or systemic infection
- Osseous abnormalities that cannot be optimally managed prior to surgery which would increase the likelihood of a poor surgical outcome (i.e., inadequate bone stock to support the implant) unless the procedure is being performed for a fracture indication
- One or more uncontrolled or unstable medical conditions that would significantly increase the risk of morbidity (e.g., cardiac, pulmonary, liver, genitourinary, or metabolic disease; hypertension; abnormal serum electrolyte levels)
- Vascular insufficiency, significant muscular atrophy of the leg, or neuromuscular disease severe enough to compromise implant stability or post-operative recovery
- Severe immunocompromised state
- Charcot joint
- Inflammatory arthropathy affecting both the femoral head and acetabulum
An impacted fracture, partially displaced fracture, completely displaced or comminuted fracture of the femoral neck or femoral head is present and conservative management or surgical fixation is not considered a reasonable option.

Osteoarthritis evidenced by large cysts in the femoral head or acetabulum, joint space obliteration, and severe deformity of the femoral head (e.g., Tönnis Grade 3 osteoarthritis or avascular necrosis with stage III collapse of the femoral head or inflammatory arthropathy affecting both the femoral head and acetabulum with joint space narrowing) when ALL of the following criteria have been met:
- Function-limiting pain at short distances (e.g., walking less than ¼ mile, limiting activity to two city blocks, the equivalent to walking the length of a shopping mall) for at least three (3) months duration
- Loss of hip function secondary to osteoarthritis which interferes with the ability to carry out age-appropriate activities of daily living and/or their demands of employment
- Failure of at least three (3) months of provider-directed non-surgical management
  - Please note: Provider-directed non-surgical management may be inappropriate for joint destruction. The medical record must clearly document why provider-directed non-surgical management is not reasonable.

Total hip replacement is considered not medically necessary when ANY of the following are present:
- Active local or systemic infection
- Osseous abnormalities that cannot be optimally managed prior to surgery which would increase the likelihood of a poor surgical outcome (i.e., inadequate bone stock to support the implant) unless the procedure is being performed for a fracture indication
- One or more uncontrolled or unstable medical conditions that would significantly increase the risk of morbidity (e.g., cardiac, pulmonary, liver, genitourinary, or metabolic disease; hypertension; abnormal serum electrolyte levels)
- Vascular insufficiency, significant muscular atrophy of the leg, or neuromuscular disease severe enough to compromise implant stability or post-operative recovery
- Severe immunocompromised state
- Charcot joint

Refer to MS-12: Osteoarthritis and MS-24: Hip for the advanced imaging indications related to hip resurfacing and hip replacement surgery.

Refer to CMM-314: Hip Surgery – Arthroscopic & Open for non-resurfacing and non-replacement treatment of avascular necrosis of the femoral head.
Revision of Hip Replacement – Partial or Total

Hip Revision is considered medically necessary for an individual who has previously undergone a partial or total hip replacement and when ANY of the following criteria have been met:

- Presence of ANY of the following:
  - Recurrent prosthetic dislocation not responsive to a reasonable course of non-surgical care
  - Instability of the components
  - Aseptic loosening
  - Periprosthetic infection
  - Periprosthetic fracture
- Unexplained function-limiting pain at short distances (e.g., walking less than ¼ mile, limiting activity to two city blocks, the equivalent to walking the length of a shopping mall) for greater than six (6) months unresponsive to provider-directed non-surgical management

Revision of hip replacement is considered not medically necessary for treatment of any other indication, including Charcot joint.

Isolated head and polyethylene liner exchange (IPE) is considered medically necessary when EITHER of the following criteria have been met:

- Eccentric Polyethylene Wear with or without Osteolysis
  - Symptomatic individual with well-fixed implants in acceptable position
- Periprosthetic joint infection
  - Individual is less than 4 weeks from the index replacement procedure with well-fixed implants

Refer to MS-16: Post-Operative Joint Replacement Surgery and MS-24: Hip for advanced imaging indications related to hip replacement surgery

Salvage Procedures

A salvage procedure (e.g., Girdlestone procedure) may be considered medically necessary as a surgical alternative in certain patients for whom primary hip replacement or revision of hip replacement is not a reasonable surgical option including ANY of the following:

- Chronic infection, osteomyelitis, or persistent periprosthetic infection
- Pre-existing ambulatory dysfunction or non-ambulatory patient
- Presence of co-morbidities or diseases which would preclude the performance of a successful hip replacement
- Inadequate bone stock (e.g., severe osteoporosis or following tumor resection when there is insufficient bone remaining to support a joint replacement)
- Recurrent instability/dislocation of the replaced hip
- Aseptic loosening of the replaced hip with no other practical surgical options
- Inability to pursue a successful reimplantation.
