## Coverage Policy

Transplantation donor expenses are covered under the transplantation recipient’s benefit plan when ALL of the following criteria are met:

- The recipient of the transplantation meets ALL of the following criteria:
  - is eligible for coverage under a Cigna health benefit plan
  - has a condition for which the proposed transplantation is considered medically necessary
  - meets the coverage criteria for transplantation
- Eligible donor meets OPTN/UNOS (Organ Procurement and Transplantation Network/United Network for Organ Sharing) donor evaluation and guideline criteria for the specific transplantation being performed (e.g., living kidney transplant, living liver transplantation).
- The organ to be donated is appropriate for the proposed transplant.
- For a bone-marrow, peripheral-blood or umbilical-cord blood stem-cell transplant, there is an identified, appropriate, allogeneic match between the donor and the recipient.
- The charges are not covered by the donor’s benefit plan.
The following are considered medically necessary or otherwise covered when the transplantation recipient is eligible for coverage for transplantation service under a Cigna health benefit plan:

- deceased (i.e., cadaveric) donor: organ/tissue procurement, including preservation, storage and transportation
- living donor:
  - solid organs: testing for related and unrelated donors as approved by Cigna
  - bone marrow, stem cell or umbilical cord blood: related-donor testing and unrelated-donor search fees and procurement if billed through the National Marrow Donor Program or other recognized marrow registry
  - prediagnostic testing expenses
  - hospital and surgical expenses for removal of the donor tissue/organ, and all services provided during the inpatient admission
  - transportation of the donated tissue/organ
  - lodging, food and transportation to and from the transplantation site for donors receiving services from a transplantation facility, for the donation procedure, for recipients who have this benefit
  - pursuant to standard contract terms, coverage is limited to 30 days of follow-up care after date of donation for transplant-related complications, if not otherwise covered by donor’s own health benefit plan

Transplantation donor expenses for non-human organ transplants are considered experimental, investigational or unproven.

Overview

This Coverage Policy addresses transplantation donor charges/expenses.

General Background

According to the U.S. Government Information on Organ Donation and Transplantation (August 2017):

- 116,000+ is the number of men, women and children on the national transplant waiting list
- 33,611 transplants were performed in 2016
- 20 people die each day waiting for a transplant
- 95% of U.S. adults support organ donation but only 54% are actually signed up as donors
- every 10 minutes another person is added to the waiting list
- only 3 in 1,000 people die in a way that allows for organ donation
- In 2016, a total of 41,335 organs were donated. More than 4 out of 5 donations came from deceased donors, and 1 out of 5 donations from living donors. 33% of deceased donors were over the age of 50; 60% of deceased donors were male, 40% female.

Solid-organ transplantation is the treatment of last resort for patients with end-stage organ disease. Many types of organs can be successfully transplanted, including the heart, lungs, kidney, small bowel, pancreas and liver. Solid-organ transplantation may be from a living or deceased (i.e., cadaveric) donor. In a solid-organ transplant, a healthy donor organ replaces the recipient’s diseased organ.

Marrow or blood cell transplantation is a life-saving treatment for numerous blood diseases, such as leukemia and lymphoma. This type of transplantation replaces the individual’s unhealthy blood cells with healthy blood-forming cells from a donor. Three sources of blood-forming cells include marrow, blood-forming cells collected from the blood (called peripheral-blood stem-cell donation [PBSC]) and umbilical cord blood. Transplantation involving the use of the individual’s own cells is referred to as an autologous transplant. During this procedure, cells are collected from the patient’s blood or, less frequently, marrow, and stored for a transplant. Using transplantation cells from a family member, an unrelated donor, or cord blood is referred to as an allogeneic transplant. Syngeneic transplantation is a transplantation method using cells from an identical twin.
Xenotransplantation refers to any procedure that involves the transplantation, implantation, or infusion into a human recipient of either (a) live cells, tissues, or organs from a nonhuman animal source; or (b) human body fluids, cells, tissues, or organs that have had ex vivo contact with live nonhuman animal cells, tissues, or organs. Interest in xenotransplantation is the result of various factors, including an insufficient number of available human organs for transplantation, advancements in genetics, and other scientific advances. However, several barriers exist to xenotransplantation and include severe rejection responses, difficulty controlling immune responses, and infectious disease issues. The U.S. Food and Drug Administration (FDA) note these Criteria for Xenotransplantation Patient Selection: “Due to the potentially serious public health risks of possible zoonotic infections, you should limit xenotransplantation to patients with serious or life-threatening diseases for whom adequately safe and effective alternative therapies are not available, except when very high assurance of safety can be demonstrated. You should limit candidates to those patients who have potential for a clinically significant improvement with increased quality of life, following the procedure. You should also consider the patient’s ability to comply with public health measures as stated in the protocol, including long-term monitoring” (FDA, 2016). Xenotransplantation is regulated by the U.S. Food and Drug Administration, nonetheless, significant concerns have been raised regarding safety, and further study is needed to demonstrate safety and impact on health outcomes.

**Solid-Organ Transplantation**

**Deceased Donors:** The ideal (deceased) organ-donor candidate is an individual who has suffered a fatal injury to the brain (with impending or actual brain death), yet has intact cardiovascular function. Potential donors must meet the following criteria:

- brain death
- free of infection
- no history of carcinoma, with the exception of low-grade skin or brain tumors
- free of severe systemic disease
- relatively normal organ function
- hemodynamically salvageable

Once a deceased donor has been identified, an organ procurement organization (OPO) coordinator will begin the process of evaluating the suitability of the donor. A complete medical and social history will be conducted to determine that the donor meets the above criteria.

**Living Donors:** Living-donor organ donation has increased due to the limited availability of deceased donor organs. Living-donor transplants are used in liver, kidney and lung transplantation, and investigations of living-donor pancreas and intestine donation are being conducted.

Kidney Disease: Improving Global Outcomes (KDIGO) published a Clinical Practice Guideline on the Evaluation and Care of Living Kidney Donors (Lentine, et al., 2017). OPTN/UNOS has issued various other guidelines, including but not limited to those for Living Donation (OPTN, 2017). Informed consent must be obtained from living donors. The donor’s signature on a document must clearly confirm that the donor:

- is willing to donate
- is free from inducement and coercion and
- has been informed that he or she may decline to donate at any time

Living donors must be provided an opportunity to discontinue the donor consent or evaluation process in a way that is protected and confidential. Living donors must be provided an Independent Living Donor Advocate (ILDA) to assist the donor during the consent process, with instruction about all phases of the living donation process, which include:

- consent
- medical and psychosocial evaluations
- pre and post-operative care
- required post-operative follow up
Living donor ILDA requirements apply to living kidney, liver, pancreas, intestine or lung donors. For any living kidney donor who is undergoing evaluation for donation, the living donor recovery hospital must designate and provide each potential living donor with an ILDA who is not involved with the potential recipient evaluation and is independent of the decision to transplant the potential recipient. The ILDA may be one person or an independent living donor advocate team with multiple members. An ILDA team must designate one person from the team as the key contact for each living donor.

The ILDA must:
1. Function independently from the transplant candidate’s team.
2. Advocate for the rights of the living donor.
3. Fulfill the qualification and training requirements specified in the recovery hospital’s protocols regarding knowledge of living organ donation, transplantation, medical ethics, informed consent, and the potential impact of family or other external pressure on the living donor’s decision about whether to donate. Document that each requirement has been met.
4. Review and document whether the living donor has received information on numerous issues (OPTN/UNOS Living Donation Policy 14; 9/12/2017).

Bone-Marrow, Peripheral-Blood and Umbilical-Cord Blood Stem-Cell Donors
Stem cells are a type of cell that can grow into other types of cells, including red blood cells, white blood cells, and platelets. They are generated in the bone marrow and found in the bone-marrow, blood-forming cells collected from the blood (called peripheral-blood stem-cell donation [PBSC]) and umbilical cord blood. Donated stem cells are used to help the recipient produce components of his or her blood compromised by disease or by the treatment of certain diseases, such as cancer.

In general, bone-marrow, peripheral-blood and umbilical-cord blood stem-cell donors must meet the following medical criteria (National Marrow Donor Program, 2017):
- between the ages of 18 and 60. Ages of 18 and 44 are preferred because younger donors produce more and higher-quality cells than older donors.
- in good health
- tissue match to recipient
- body mass index (BMI) of 40 or less

Bone-Marrow Donor: Bone-marrow donation involves a minor surgical procedure, which is performed under local or general anesthetic. Four to eight small incisions are made in the pelvic area, and bone marrow is extracted with a surgical needle. The process takes 45–90 minutes. The donor may initially have soreness at the donation sites, but a full recovery generally occurs within a few days. The donor’s system will completely replace the extracted marrow within a few weeks, since marrow continuously regenerates itself.

Peripheral-Blood Stem-Cell (PBSC) Donor: PBSC donation requires the donor to receive medication, such as growth factor (e.g., filgrastim), for several days to increase the number of stem cells released from the bone marrow into the bloodstream. Donors may experience bone pain, muscle pain, nausea, insomnia and fatigue from the medication. The stem cells are collected by apheresis. In apheresis, blood is drawn through a needle from one arm, run through an apheresis machine that separates out the stem cells, and is returned through a needle in the other arm. Donors may not feel well during the donation, but generally make a full recovery immediately following the donation.

Umbilical-Cord Blood Stem-Cell Donor: Umbilical-cord blood contains large numbers of stem cells. After a baby’s birth, blood is collected from the placenta and umbilical cord. There is no physical effect on the mother or the infant.

Transplant Tourism
Each year the number of patients on a waiting list for transplantation exceeds the number of patients receiving transplants. An increase in the wait time for transplantation may result in increased risk for clinical deterioration, reduced quality of life, and, in some cases, deaths of patients on the waiting list. This has led to an increase in the number of patients seeking organs from other countries for the purpose of transplant. Transplant tourism is the purchase of transplantation organs abroad which includes access to an organ while bypassing laws, rules or
processes of any or all countries involved (UNOS, 2007). According to the American Society of Transplantation (AST) and the board of directors at UNOS the practice of transplantation tourism is poorly regulated.

In 2006, UNOS adopted a position statement opposing the practice of transplantation tourism. In 2007, UNOS amplified their position and reported, “The UNOS Ethics Committee condemns the practice of transplantation tourism. Participation in such a practice cannot be defended on ethical or current empirical grounds.” UNOS further reported it is the obligation of the transplantation community not only to condemn the practice but to endorse ethically defensible policies which would render such practices unnecessary.

The Transplantation Society (TTS), an organization for worldwide advancement of organ transplantation, holds the position that a practice that has no transparency or professional oversight violates ethical principles of care, and they are opposed to practices of transplantation tourism that exploit donors and recipients.

Despite concerns, however, UNOS and AST both agree that post-transplantation medical treatment should be provided to individuals who have received an organ through transplantation tourism.

The American Board of Internal Medicine’s (ABIM) Foundation Choosing Wisely® Initiative (2017)
No relevant information found.

Use Outside of the US
National Institute for Health and Care Excellence (NICE) has a 2011 guideline titled Organ donation for transplantation: improving donor identification and consent rates for deceased organ donation (CG135). It was updated in December 2016. It offers best practice advice on improving donor identification and consent rates.

**Coding/Billing Information**

**Note:** 1) This list of codes may not be all-inclusive.
2) Deleted codes and codes which are not effective at the time the service is rendered may not be eligible for reimbursement.

**Considered Medically Necessary when criteria in the applicable policy statements listed above are met:**
